L6   ANSWER 1 OF 8  CAPLUS  COPYRIGHT 2009 ACS on STN
AB   The invention provides major histocompatibility complex (MHC) multimers
     comprising: (a) one or more MHC class I or class II antigens; (b) one or
     more antigenic peptides from pathogenic organisms (such as Borrelia)
     capable of binding to the MHC antigens; (c) linker mols.; and
     (d) multimerization domains that bind to the MHC complex and
     linker, and synthetic and recombinant methods for producing said
```

MHC multimers. The invention relates that said MHC multimers contain labels that include dyes, enzymes and/or radioactive mols., and that the multimers may contain an addnl. mol. related to a biol. activity, such as T cell activation, antigen presentation and/or therapy. The invention also relates that the multimerization domains are different types of carrier or scaffold mols., and include small mols., polymers, streptavidin, IgG, cells, liposomes and/or beads. The invention also provides the amino acid sequences of antigen peptides from Borrelia proteins, such as flagellins, outer membrane proteins and heat-shock proteins. The invention further provides for the use of said MHC multimers in immunization of individuals against diseases, such as Lyme disease, birrekusis and recurring fever, and in the diagnosis of a disease, and/or in the detection of T cells specific for a particular antigen. Finally, the invention provides for various methods used in detecting T cells specific for particular antigens.

L6 ANSWER 2 OF 8 CAPLUS COPYRIGHT 2009 ACS on STN

AB The present invention describes novel methods to generate MHC or HLA multimers and methods to improve existing and new MHC multimers. The invention also describes improved methods for the use of MHC multimers in anal. of T-cells in samples 5 including diagnostic and prognostic methods. Furthermore the use of MHC multimers in therapy are described, e.g. anti-tumor and anti-virus therapy, including isolation of antigen specific T-cells capable of inactivation or elimination of undesirable target cells or isolation of specific T-cells capable of regulation of other immune cells.

L6 ANSWER 3 OF 8 CAPLUS COPYRIGHT 2009 ACS on STN
AB There is provided an organic-inorg. composite material containing a single nanoparticle therein, which is prepared by individually dispersing hydrophilic inorg. nanoparticles having a uniform particle size and conjugating biodegradable polymers to the surface of the nanoparticle, and a method of preparing the same. More particularly, the preparation method of the
present invention comprises the following steps: (1) preparing hydrophilic nanoparticles by conjugating organic substances having a thiol group and a hydrophilic amine group to the surface of a core or a core/shell inorg. nanoparticle protected with a surfactant through a metal-thiolate (M-S) bond between them; (2) adjusting the concentration of the hydrophilic nanoparticles prepared in step (1) to 2+10-6 M or less and treating them in a sonication bath to prepare individually dispersed nanoparticles in the form of a single particle; and (3) conjugating biopolymers to the nanoparticle individually dispersed in step (2) through the formation of an amide bond between them under treatment in a sonication bath. The organic-inorg. composite material of the present invention exhibits high efficient photoluminescence and photostability as well as excellent chemical stability, dispersibility in water, biocompatibility and targetibility. Thus, it can be effectively used as a raw material for bioimaging or film coating. In an example, a hydrophobic CdSe/CdS quantum-dot solution was mixed with HSCH2CH2NH2·HCl to give a precipitate which is then conjugated with polyethylene glycol monomethyl ether mono(succinimidyl succinate) to prepare a composite.

AB The present invention encompasses IL-12p40 binding proteins, particularly antibodies that bind human interleukin-12 (hIL-12) and/or human IL-23 (hIL-23). Specifically, the invention relates to antibodies that are chimeric, CDR grafted and humanized antibodies. Preferred antibodies have high affinity for hIL-12 and/or hIL-23 and neutralize h IL-12 and/or hIL-23 activity in vitro and in vivo. An antibody of the invention can be a full-length antibody or an antigen-binding portion thereof. Method of making and method of using the antibodies of the invention are also provided. The antibodies, or antibody portions, of the invention are useful for detecting hIL-12 and/or hIL-23 and for inhibiting hIL-12 and/or hIL-23 activity, e.g., in a human subject suffering from a disorder in which hIL-12 and/or hIL-23 activity is detrimental.

L6 ANSWER 5 OF 8 CAPLUS COPYRIGHT 2009 ACS on STN

AB Disclosed is a hyaluronic acid/methotrexate compound useful as a therapeutic agent for joint diseases. The hyaluronic acid/methotrexate compound useful for the treatment of joint diseases comprises hyaluronic acid and methotrexate bonded to a hydroxy group of the acid through a linker having a peptide chain comprising one to eight amino acids, the linker being bonded to the hyaluronic acid through a carbamate group. Thus, a methotrexate derivative [MTX(Et)-α-PhePhe-NH-C10H20O3-NH2] was prepared and reacted with p-nitrophenylchloroformate. The obtained phenylcarbamate compound 4,7,10-trioxa-13-[N-[N-[N-[4-[[(2,4-diamino-6-pteridinyl)methyl]methylamino]benzoyl]-α-(O5-methylglutamyl)]phenylalanyl]phenylalanylamino]tridecanylamine [MTX(Et)-α-PhePhe-NH-C10H20O3-NHCO-O-C6H4-NO2] was reacted with sodium hyaluronate to give a hyaluronic acid /methotrexate compound of the present invention. The compound showed excellent antiarthritic effect in rat.

AB Disclosed is a hyaluronic acid/methotrexate compound useful as a therapeutic agent for joint diseases. The hyaluronic acid/methotrexate compound useful as a therapeutic agent for joint diseases comprises hyaluronic acid and methotrexate bonded to a carboxy group of the acid through a linker having a peptide chain comprising one to eight amino acids. For example, 2-[N-[N-[N-[4-[[(2,4-diamino-6-pteridinyl)methyl]methylamino]benzoyl]-α-(O5-methylglutamyl)]phenylalanyl]phenylalanylamino]ethylamine (MTX-α-PhePhe-NHC2H4NH2) was prepared and reacted with sodium hyaluronate to obtain a conjugate, to examine its effect in arthritis model rats.

AB The present invention relates to methods for. the production of monomeric cytotoxic drug/carrier conjugates (the "conjugates") with higher drug loading and substantially reduced low conjugate fraction (LCF). Cytotoxic drug derivative/antibody conjugates, compns. comprising the conjugates and uses of the conjugates are also described. Particularly, the invention relates to anti-CD22 antibody-monomeric calicheamicin conjugates . The invention also relates to the conjugates of the invention, to methods of purification of the conjugates, to pharmaceutical compns. comprising the conjugates, and to uses of the conjugates.

L6 ANSWER 8 OF 8 CAPLUS COPYRIGHT 2009 ACS on STN

AB The present invention provides protein conjugates having a glucose-aminoglycan-targeting domain conjugated directly or indirectly to a therapeutically useful protein via chemical or peptidyl linkage. A conjugate of the invention is disclosed in which a hyaluronan-binding protein is a receptor for hyaluronic acid-mediated mobility (RHAMM). The protein conjugates selectively target certain tissues and organs and are useful for treating or preventing various physiol. and pathol. conditions. Methods of their use and preparation are described.
